HTML Homework

You need to create a site called, "My LinkZ".

- It has the following site layout:
  o The main page called "index.html" contains:
    ▪ the 5 top links, and 5 new links
    ▪ a list of links to other categories
    ▪ a link to the about page
  o Each category page contains:
    ▪ A list of links to external web pages in that category
    ▪ A list of links to all other categories
    ▪ A link to the about page
  o Each page has a header with a logo, and footer with some copyright information, etc.

1. Create the HTML pages for this site:
   - Assume that there are 3 categories (i.e. puppies, python, and programming) and 5 web pages in each category
   - Use <div> elements to provide structure to your page.
   - To create a link use the <a> tag, for example in your "index.html" page:

   Python Page
   Puppy Page

The href refers to where the file or url is.

- How many HTML pages need to be created?

2. Update the site map:
   - How many pages need to be created if one more category is added?
   - How many pages need to be created if one new external web page is added to a category?
   - What if we added five more categories?

3. Assuming now we have 3 + 1+ 5 = 9 categories:
   - How many pages need to change if we update the header or footer?

4. What are the problems with this design/solution?
